

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

1. (Canceled)

2. (Canceled)

3. (Currently Amended) A retroreflective device according to claim 2,
comprising a substantially spherical graded refractive index lens, a reflective part for
retroreflecting a radiation beam passing through the graded refractive index lens
and, at least partially surrounding the lens, a non-gaseous transparent material
having a substantially uniform refractive index, wherein said graded refractive index
lens has a gradually varying, spherically symmetric, refractive index distribution, and
wherein said refractive index distribution includes parts having at least two separate
radial extents within which the material of the lens has a continuously varying
refractive index, the refractive index variation having a gradient discontinuity
between said two radial extents.

4. (Currently Amended) The A device according to claim1 Claim 3, wherein
said graded refractive index lens has a refractive index at its centre which is greater
than a refractive index at its outer surface.

5. (Currently Amended) The A device according to claim1 Claim 3, wherein said transparent material has a refractive index which is less than a refractive index of said graded refractive index lens at its outer surface.

6. (Currently Amended) The A device according to claim1 Claim 3, wherein a ratio of the refractive index of said graded refractive index lens at its outer surface to a refractive index of said transparent material is between ~~1 and 2~~ 1:1 and 2:1.

7. (Currently Amended) The A device according to claim1 Claim 3, wherein a ratio of the refractive index of said graded refractive index lens at its centre to a refractive index of said transparent material is between ~~1 and 2~~ 1:1 and 2:1.

8. (Currently Amended) The A device according to claim1 Claim 3, wherein said transparent material surrounds at least approximately one half of the lens.

9. (Currently Amended) The A device according to claim1 Claim 3, wherein at least part of said transparent material is located between said graded refractive index lens and the reflective part.

10. (Currently Amended) The A device according to claim1 Claim 3, wherein said reflective part includes a substantially spherical reflective surface arranged concentrically with respect to said graded refractive index lens.

11. (Currently Amended) The A device according to claim 1 Claim 3, wherein
having a boundary of the transparent material remote from said lens, and through
which a radiation beam passes to be retroreflected, wherein said boundary is defined
by a substantially spherical transparent surface arranged concentrically with respect
to the graded refractive index lens, and wherein said reflective part includes a
substantially spherical reflective surface arranged concentrically with respect to said
graded refractive index lens.

12. (Currently Amended) The A device according to claim 10 and 11, wherein
said substantially spherical reflective surface and substantially spherical transparent
surface have substantially the same radius of curvature.

13. (Currently Amended) The A device according to claim 10 and 11, wherein
said substantially spherical reflective surface and substantially spherical transparent
surface have different radii of curvature.

14. (Original) The A device according to claim 13, wherein said substantially
spherical reflective surface has a smaller radius of curvature than that of said
substantially spherical transparent surface.

15. (Currently Amended) The A device according to claim 1 Claim 3, wherein
having a boundary of the transparent material remote from said lens, and through
which a radiation beam passes to be retroreflected, wherein said boundary is defined
by a substantially planar surface.

16. (Currently Amended) A device according to ~~claim1~~ Claim 3, wherein said transparent material comprises a solid moulded component.

17. (Currently Amended) A device according to ~~claim1~~ Claim 3, wherein said transparent material has a refractive index greater than 1.3.

18. (Currently Amended) A device according to ~~claim1~~ Claim 3, wherein said graded refractive index lens has a refractive index distribution which averages, across a radial cross-section, between 1.4 and 1.8.

19. (Canceled)

20. (Canceled)
